D = 5 black holes on a cylinder

In the absence of black holes, we have $\mathbb{M}^{1,3} \times S^1$:

$$ds^{2} = \underbrace{-dt^{2} + dx^{2} + dy^{2} + y^{2}d\phi^{2}}_{\mathbb{M}^{1,3}} + \underbrace{dz^{2}}_{S^{1}}$$

Conclusions

BH in a box

- Studied stability of rotating BH and gravitational radiation in boxed spacetime;
- Results consistent with expectations for wavepacket of radiation travelling back and forth
- BH in de Sitter
 - Evolved head-on collision of BHs in asymptotically de Sitter spacetime and monitored apparent horizons;
 - ToDo: Study formation of common apparent horizon as function of initial separation;
- 5D cylinder
 - Successfully evolved head-on collision of BHs in a 5*D* cylindrical spacetime using dimensional reduction procedure;
 - ToDo: deformation of the apparent horizon; radiated energy; smaller compactification radius;
